

Create a new database called InstaClone in MySQL Workbench, then create a table named Users with columns: user_id (INT, primary key), username (VARCHAR), email (VARCHAR), and followers_count (INT).

```
CREATE TABLE `users` (  
  `user_id` int(11) NOT NULL,  
  `username` varchar(30) DEFAULT NULL,  
  `email` varchar(30) DEFAULT NULL,  
  `followers_count` int(11) DEFAULT NULL  
)
```

Insert 3 sample users into the Users table you created, using realistic Instagram-style usernames and follower counts.

```
INSERT INTO `users` (`user_id`, `username`, `email`, `followers_count`) VALUES  
(1, 'sneha', 'sneha@gmail.com', 500),  
(2, 'ashav', 'ashav@gmail.com', 1000),  
(3, 'diya', 'diya@gmail.com', 2000);
```

Create another table in the InstaClone database called Posts with columns: post_id (INT, primary key), user_id (INT), caption (VARCHAR), and post_date (DATE). Add a foreign key from Posts.user_id to Users.user_id to establish a relationship.

```
CREATE TABLE `post` (  
  `post_id` int(11) NOT NULL,  
  `user_id` int(11) DEFAULT NULL,  
  `caption` varchar(20) DEFAULT NULL,  
  `post_date` date DEFAULT NULL  
)
```

Write a short comparison (3-4 lines each) of MySQL, PostgreSQL, Oracle, and SQLite, focusing on where each one is commonly used (for example: web apps, mobile apps, enterprise systems, etc.).

MySQL

- Commonly used for **web applications** and websites.
- Popular with PHP, WordPress, and many backend applications.
- Easy to use and suitable for small to large-scale projects.

PostgreSQL

- Commonly used for **complex web applications and data-heavy systems**.
- Known for advanced SQL features and strong data integrity.
- Often used in analytics, financial applications, and modern backend systems.

Oracle

- Mainly used in **large enterprise systems**.
- Common in banking, government, telecom, and large organizations.
- Designed for high performance, security, and handling very large databases.

SQLite

- Commonly used in **mobile apps, desktop applications, and embedded systems**.
- Stores the entire database in a single file, so no separate server is required.
- Popular for Android/iOS apps and small local applications
